Marks Obtained : 15

Section 1 : MCQ

1. What will be the output for the following code?

```
import java.io.*;  
  
class NegativeAgeException extends Exception {  
    public NegativeAgeException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        try {  
            int age = -5;  
            if (age < 0) {  
                throw new NegativeAgeException("Age cannot be negative");  
            }  
        } catch (NegativeAgeException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

```
        }
    } catch (NegativeAgeException e) {
        System.out.println(e.getMessage());
    }
}
```

Answer

Age cannot be negative

Status : Correct

Marks : 1/1

2. What will be the output for the following code?

```
class InvalidVotingAgeException extends Exception {
    public InvalidVotingAgeException(String message) {
        super(message);
    }
}
```

```
class Test {
    public static void main(String[] args) {
        try {
            int age = 15;
            if (age < 18) {
                throw new InvalidVotingAgeException("You are not eligible to
vote");
            }
            System.out.println("Eligible to vote");
        } catch (InvalidVotingAgeException e) {
            System.out.println(e.getMessage());
        }
    }
}
```

Answer

You are not eligible to vote

Status : Correct

Marks : 1/1

3. what is the output of the following code?

```
class MyException extends Exception {  
    public MyException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    static void check() throws MyException {  
        throw new MyException("Custom Exception Occurred");  
    }  
  
    public static void main(String[] args) {  
        try {  
            check();  
        } catch (Exception e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

Answer

Custom Exception Occurred

Status : Correct

Marks : 1/1

4. How do you create an unchecked custom exception?

Answer

By extending RuntimeException

Status : Correct

Marks : 1/1

5. What will be the output for the following code?

```
import java.io.*;
```

```
240701309 class UnderageException extends Exception {  
240701309     public UnderageException(String message) {  
240701309         super(message);  
240701309     }  
240701309 }  
240701309  
240701309 class Test {  
240701309     public static void main(String[] args) {  
240701309         try {  
240701309             int age = 17;  
240701309             if (age < 18) {  
240701309                 throw new UnderageException("Underage, cannot proceed");  
240701309             }  
240701309         } catch (UnderageException e) {  
240701309             System.out.println(e.getMessage());  
240701309         }  
240701309     }  
240701309 }
```

Answer

Underage, cannot proceed

Status : Correct

Marks : 1/1

6. What will be the output for the following code?

```
240701309 class InvalidUsernameException extends Exception {  
240701309     public InvalidUsernameException(String message) {  
240701309         super(message);  
240701309     }  
240701309 }  
240701309  
240701309 class Test {  
240701309     public static void main(String[] args) {  
240701309         try {  
240701309             String username = "abc";  
240701309             if (username.length() < 5) {  
240701309                 throw new InvalidUsernameException("Username must be at  
240701309 least 5 characters long");  
240701309             }  
240701309         }  
240701309     }
```

```
        }
    } catch (InvalidUsernameException e) {
        System.out.println(e.getMessage());
    }
}
```

Answer

Username must be at least 5 characters long

Status : Correct

Marks : 1/1

7. What will happen if a checked custom exception is thrown inside a method without being caught or declared?

Answer

Compilation Error

Status : Correct

Marks : 1/1

8. What will be the output for the following code?

```
import java.io.*;
```

```
class OutOfStockException extends Exception {
    public OutOfStockException(String message) {
        super(message);
    }
}
```

```
class Test {
    public static void main(String[] args) {
        try {
            int stock = 0;
            if (stock == 0) {
                throw new OutOfStockException("Item is out of stock");
            }
        } catch (OutOfStockException e) {
```

```
        System.out.println(e.getMessage());
    }
}
}
```

Answer

Item is out of stock

Status : Correct

Marks : 1/1

9. what is the output of the following code?

```
class MyException extends Exception {
    public MyException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            throw new MyException("Error occurred");
        } catch (MyException e) {
            System.out.println(e);
        }
    }
}
```

Answer

MyException: Error occurred

Status : Correct

Marks : 1/1

10. What will be the output for the following code?

```
class NegativeBalanceException extends Exception {
    public NegativeBalanceException(String message) {
        super(message);
    }
}
```

```
}

class Test {
    public static void main(String[] args) {
        try {
            double balance = -500;
            if (balance < 0) {
                throw new NegativeBalanceException("Balance cannot be
negative");
            }
        } catch (NegativeBalanceException e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

Answer

Error: Balance cannot be negative

Status : Correct

Marks : 1/1

11. What is the purpose of a custom exception in Java?

Answer

To create user-defined exceptions for specific scenarios

Status : Correct

Marks : 1/1

12. What will be the output for the following code?

```
import java.io.*;
```

```
class TemperatureTooHighException extends Exception {
    public TemperatureTooHighException(String message) {
        super(message);
    }
}
```

```
class Test {  
    public static void main(String[] args) {  
        try {  
            int temperature = 110;  
            if (temperature > 100) {  
                throw new TemperatureTooHighException("Temperature too  
high");  
            }  
        } catch (TemperatureTooHighException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

Answer

Temperature too high

Status : Correct

Marks : 1/1

13. What will be the output of the following code?

```
class MyException extends Exception {  
    public MyException() {  
        super("Default Exception Message");  
    }  
}
```

```
24  
class Test {  
    public static void main(String[] args) {  
        try {  
            throw new MyException();  
        } catch (MyException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

Answer

Default Exception Message

Status : Correct

Marks : 1/1

14. Which keyword is used to explicitly throw a custom exception?

Answer

throw

Status : Correct

Marks : 1/1

15. Which of the following is true about custom exceptions?

Answer

Custom exceptions must extend either Exception or RuntimeException

Status : Correct

Marks : 1/1

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a ". " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
// You are using Java
import java.util.*;

class DotException extends Exception{
    public DotException(String message){
        super(message);
    }
}

class AtTheRateException extends Exception{
    public AtTheRateException(String message){
        super(message);
    }
}

class DomainException extends Exception{
    public DomainException(String message){
        super(message);
    }
}

public class Main{
    public static void main(String[] args){
        Scanner scanner = new Scanner(System.in);
        String email = scanner.nextLine();
        scanner.close();

        try{
            validateEmail(email);
            System.out.println("Valid email address");
        }
        catch(DotException e){

```

```
        System.out.println("DotException: "+e.getMessage());
        System.out.println("Invalid email address");
    }
    catch(DomainException e){
        System.out.println("DomainException: "+e.getMessage());
        System.out.println("Invalid email address");
    }
    catch(AtTheRateException e){
        System.out.println("AtTheRateException: "+e.getMessage());
        System.out.println("Invalid email address");
    }
}

public static void validateEmail(String email) throws
DotException,DomainException,AtTheRateException{
    int atCount=email.length()-email.replace("@","");
    if(atCount!=1){
        throw new AtTheRateException("Invalid @ usage");
    }

    String[] parts=email.split("@");
    if(parts.length!=2|| parts[0].isEmpty()|| parts[1].isEmpty()){
        throw new AtTheRateException("Invalid @ usage");
    }

    String beforeAt=parts[0];
    String afterAt=parts[1];

    if(email.startsWith(".") || email.endsWith(".")){
        throw new DotException("Invalid Dot usage");
    }
    if(afterAt.indexOf('.')==-1){
        throw new DotException("Invalid Dot usage");
    }

    String[] domainParts = afterAt.split("\\.");
    if(domainParts.length!=2){
        throw new DotException("Invalid Dot usage");
    }

    String domainName=domainParts[0];
    String domainExt=domainParts[1];
```

```
        List<String> validDomains = Arrays.asList("in","com","net","biz");
        if(!validDomains.contains(domainExt)){
            throw new DomainException("Invalid Domain");
        }
    }
}
```

1. Problem Statement

Elsa, a busy professional, is using a scheduling application to plan her meetings efficiently. The application requires users to input meeting durations in minutes, ensuring that the duration is a positive integer and does not exceed 240 minutes (4 hours). Elsa needs a program to assist her in scheduling meetings securely with proper exception handling.

Create a Java class named ElsaMeetingScheduler. Implement a custom exception: InvalidDurationException for invalid meeting duration entries. Implement the main method to interactively take user input for a meeting duration. Implement the validateMeetingDuration method to validate the meeting duration based on the specified rules and throw a custom exception if the validation fails. Print appropriate success or error messages based on the meeting duration.

Implement a custom exception, `InvalidDurationException`, to handle cases where the entered meeting duration does not meet the specified criteria.

Input Format

The input consists of an integer value '`n`', representing the meeting duration.

Output Format

The output is displayed in the following format:

If the entered meeting duration meets the specified criteria, the program outputs
"Meeting scheduled successfully!"

If the entered meeting duration is invalid, the program outputs an error message indicating the issue.

"Error: Invalid meeting duration. Please enter a positive integer not exceeding 240 minutes (4 hours)."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 120

Output: Meeting scheduled successfully!

Answer

```
// You are using Java
import java.util.*;
class InvalidDurationException extends Exception{
    public InvalidDurationException(String message){
        super(message);
    }
}
public class Main{
    public static void validateMeetingDuration(int duration) throws
    InvalidDurationException{
        if(duration <=0 || duration>240){
            throw new InvalidDurationException("Invalid meeting duration.");
        }
    }
}
```

```
public static void main(String args[]){
    Scanner sc= new Scanner(System.in);
    int duration=sc.nextInt();
    try{
        validateMeetingDuration(duration);
        System.out.println("Meeting scheduled successfully!");
    }
    catch(InvalidDurationException e){
        System.out.println("Error: Invalid meeting duration. Please enter a positive
integer not exceeding 240 minutes (4 hours).");
    }
}
```

1. Problem Statement

In a user registration system, there is a requirement to implement a username validation module. Users attempting to register must adhere to specific criteria for their usernames to be considered valid.

Your task is to develop a program that takes user input for a desired username and validates it according to the following rules:

The username must not contain any spaces. The username must be at least 5 characters long.

Implement a custom exception, InvalidUsernameException, to handle cases where the entered username does not meet the specified criteria.

Input Format

The input consists of a string S, representing the desired username.

Output Format

If the username is valid, print "Username is valid: [S]" .

If the username is invalid:

1. If the username is short, print "Invalid Username: Username must be at least 5 characters long"
2. If the username contains spaces, print "Invalid Username: Username cannot contain spaces"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: John

Output: Invalid Username: Username must be at least 5 characters long

Answer

```
// You are using Java
import java.util.*;
class InvalidUsernameException extends Exception{
    public InvalidUsernameException(String message){
        super(message);
    }
}

public class Main{
    public static void ValidateUsername(String username) throws
    InvalidUsernameException{
        if(username.contains(" ")){
            throw new InvalidUsernameException("Invalid Username: Username
cannot contain spaces");
        }
        if(username.length()<5){
            throw new InvalidUsernameException("Invalid Username: Username must
be at least 5 characters long");
        }
    }
}
```

```
public static void main(String args[]){
    Scanner sc=new Scanner(System.in);
    String s=sc.nextLine();
    try{
        ValidateUsername(s);
        System.out.println("Username is valid: "+s);
    }
    catch(InvalidUsernameException e){
        System.out.println(e.getMessage());
    }
}

1. Problem Statement

A local municipality is implementing an online voting system for a community event and wants to ensure that only eligible voters (those aged 18 or older) can participate.

Your task is to develop a program that validates the age of individuals attempting to vote online. If the user's age is below 18, the program should throw a custom exception, `InvalidAgeException`, preventing them from casting their vote. If the input is invalid, catch the appropriate `InputMismatchException` and print the in-built exception message.

Input Format

The input consists of an integer representing the age.

Output Format

If the age is 18 or older, print "Eligible to vote"

If the age is below 18, print "Exception occurred: InvalidAgeException: Age is not valid to vote"

If there is any other type of exception, print "An error occurred: " followed by the in-built exception message.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20

Output: Eligible to vote

Answer

```
// You are using Java
import java.util.*;

class InvalidAgeException extends Exception{
    public InvalidAgeException(String message){
        super(message);
    }
}

public class Main{
    public static void ValidateAge(int age) throws InvalidAgeException{
        if(age<18){
            throw new InvalidAgeException("Age is not valid to vote");
        }
    }

    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        try{
            int age=sc.nextInt();
            ValidateAge(age);
            System.out.println("Eligible to vote");
        }
        catch(InvalidAgeException e){
```

```
        System.out.println("Exception occurred: InvalidAgeException:  
        "+e.getMessage());  
    }  
    catch(InputMismatchException e){  
        System.out.println("An error occurred: java.util.InputMismatchException");  
    }  
    catch(Exception e){  
        System.out.println("An error occurred: "+e.getMessage());  
    }  
}

Section 1 : Coding

1. Problem Statement

In a file management system, users are required to provide a valid file name when creating new files. The system enforces specific rules for file names to maintain consistency and avoid potential issues. Your task is to implement a Java program named FileNameValidator that takes user input for a file name and validates it according to the specified rules.

Rules for Valid File Name:

The file name must consist of alphanumeric characters (letters and digits) only. The file name must have a minimum length of 3 characters.

Implement a custom exception, FileNameValidator, to handle cases where the entered filename does not meet the specified criteria.

Input Format

The input consists of a string S, representing the desired filename.

Output Format

The output is displayed in the following format:

If the entered file name meets the specified criteria, the program outputs

"Valid file name"

If the entered file name does not meet the criteria and triggers the `InvalidFileNameException`, the program outputs

"Error: Invalid file name. It must be alphanumeric and have a minimum length of 3 characters."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: myfile123

Output: Valid file name

Answer

```
// You are using Java
import java.util.*;

class InvalidFileNameException extends Exception{
    public InvalidFileNameException(String message){
        super(message);
    }
}

public class Main{
    public static void ValidateFileName(String fileName) throws
    InvalidFileNameException{
        if(fileName.length()<3 || !fileName.matches("[A-Za-z0-9]+")){
            throw new InvalidFileNameException("Invalid file name");
        }
    }

    public static void main(String args[]){
}
```

```
Scanner sc= new Scanner(System.in);
String fileName=sc.nextLine();
try{
    ValidateFileName(fileName);
    System.out.println("Valid file name");
}
catch(InvalidFileNameException e){
    System.out.println("Error: Invalid file name. It must be alphanumeric and
have a minimum length of 3 characters.");
}

1. Problem Statement

Enigma is developing a simple web application that takes a user-input URL, validates it, and throws a custom exception InvalidURLException if the URL does not start with "http://" or "https://".

The main method prompts the user for input, validates the URL, and prints whether it is valid or not.

Input Format

The input consists of a string, representing the URL entered by the user.

Output Format

The output displays one of the following results:

If the entered URL is valid according to the specified format, the program prints:

"[URL] is a valid URL"

If the entered URL is not valid according to the specified format, the program prints:

"Invalid URL format: [URL]"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: http://www.example.com

Output: http://www.example.com is a valid URL

Answer

```
// You are using Java
import java.util.*;

class InvalidURLException extends Exception{
    public InvalidURLException (String message){
        super(message);
    }
}

public class Main{
    public static void ValidateURLFormat(String url) throws
    InvalidURLException{
        if(!((url.startsWith("http://")) || (url.startsWith("https://")))){
            throw new InvalidURLException("Invalid URL format");
        }
    }

    public static void main(String args[]){
        Scanner sc= new Scanner(System.in);
        String url=sc.nextLine();
```

```
try{
    ValidateURLFormat(url);
    System.out.println(url+" is a valid URL");
}
catch(InvalidURLException e){
    System.out.println("Invalid URL format: "+ url);
}
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

Daniel is developing a program to verify the age of users. He wants to ensure that the entered age is within a valid range. Write a program to help Daniel implement this age-checking feature using custom exceptions.

Daniel needs a program that takes an integer input representing a person's age. If the age is between 0 and 150 (inclusive), the program should print "Age is valid!". If the age is less than 0 or greater than 150, the program should throw a custom exception (InvalidAgeException) with the message "Invalid age. Please enter an age between 0 and 150."

Implement a custom exception, InvalidAgeException, to handle cases where the entered age does not meet the specified criteria.

Input Format

The input consists of an integer value 'n', representing the age.

Output Format

The output is displayed in the following format:

If the age is valid (between 0 and 150, inclusive), print

"Age is valid!".

If the age is invalid, print

"Error: Invalid age. Please enter an age between 0 and 150."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 45

Output: Age is valid!

Answer

```
// You are using Java
import java.util.*;

class InvalidAgeException extends Exception{
    public InvalidAgeException(String message){
        super(message);
    }
}

public class Main{
    public static void validateAge(int age) throws InvalidAgeException{
        if(age<0 || age>150){
            throw new InvalidAgeException("Invalid age");
        }
    }

    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        int age=sc.nextInt();
        try{
            validateAge(age);
            System.out.println("Age is valid!");
        }
        catch(InvalidAgeException e){
            System.out.println("Error: Invalid age. Please enter an age between 0 and
150.");
        }
    }
}
```

Status : Correct

Marks : 10/10

3. Problem Statement

An HR software system is being developed to process employee payrolls. During payroll processing, the system must ensure that no employee has a negative salary and that no employee's salary exceeds 2,00,000. If either condition occurs, the system should throw a custom exception.

Create a custom exception `InvalidSalaryException` and a class `Employee` that processes salary according to the following rules:

If `salary < 0`, throw `InvalidSalaryException` with the message: "Salary cannot be negative". If `salary > 200000`, throw `InvalidSalaryException` with the message: "Salary exceeds threshold limit". Otherwise, display: "Salary processed successfully for <empName>: <salary>".

The payroll processing should always display: "Payroll process completed" at the end, regardless of whether an exception occurs.

Input Format

The first line of input contains an integer representing the employee ID.

The second line contains a string representing the employee's name.

The third line contains a floating-point number representing the salary of the employee.

Output Format

If the salary is valid: "Salary processed successfully for <empName>: <salary>"

"Payroll process completed"

If the salary is invalid: "<Exception Message>"

"Payroll process completed"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 101
Rahul
150000.0

Output: Salary processed successfully for Rahul: 150000.0
Payroll process completed

Answer

```
// You are using Java
import java.util.*;

class InvalidSalaryException extends Exception{
    public InvalidSalaryException(String message){
        super(message);
    }
}

public class Main{
    public static void validateSalary(double salary) throws InvalidSalaryException{
        if (salary<0){
            throw new InvalidSalaryException("Salary cannot be negative");
        }
        else if(salary>200000){
            throw new InvalidSalaryException("Salary exceeds threshold limit");
        }
    }

    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        int empno=sc.nextInt();
        sc.nextLine();
        String name=sc.nextLine();
        double salary=sc.nextDouble();
        try{
            validateSalary(salary);
            System.out.println("Salary processed successfully for "+ name +": "+salary);
        }
        catch(InvalidSalaryException e){
            System.out.println(e.getMessage());
        }
        finally{
            System.out.println("Payroll process completed");
        }
    }
}
```

}

4. Problem Statement

You are tasked to create a program that defines a custom exception GradeException. The program should include a Student class with fields for the student's name, age, and grade. Implement a method in the Student class that checks the grade, and if the grade is below 40, it should throw a GradeException. Otherwise, it should display the student's details.

Input Format

The input consists of three parameters in separate lines:

1. A string representing the student's name.
2. An integer representing the student's age.
3. An integer representing the student's grade.

Output Format

The output will display the student's details if the grade is valid.

If the grade is below 40, the program will display an error message "Grade is below 40".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: Alice

20

85

Output: Name: Alice

Age: 20

Grade: 85

Answer

```
// You are using Java
```

```
import java.util.*;  
  
class GradeException extends Exception{  
    public GradeException(String message){  
        super(message);  
    }  
}  
  
public class Main{  
    public static void validateGrade(int grade) throws GradeException{  
        if(grade<40){  
            throw new GradeException("Grade is below 40");  
        }  
    }  
  
    public static void main(String args[]){  
        Scanner sc=new Scanner(System.in);  
        String name=sc.nextLine();  
        int age=sc.nextInt();  
        int grade=sc.nextInt();  
        try{  
            validateGrade(grade);  
            System.out.println("Name: "+name);  
            System.out.println("Age: "+age);  
            System.out.println("Grade: "+grade);  
        }  
        catch(GradeException e){  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

1. Problem Statement

Faustus is managing his bank account and wants to create a program to update his account balance based on certain conditions. However, he needs to handle specific scenarios related to invalid inputs and insufficient balances. Faustus wants to update his account balance. He inputs the current balance and the amount to be updated.

The initial account balance should be positive. If Faustus enters a negative initial balance, the program should throw an `InvalidAmountException` with the message "Invalid amount. Please enter a positive initial balance." If the amount to be updated is negative, the program should check if the subtraction results in a negative balance. If so, it should throw an `InsufficientBalanceException` with the message "Insufficient balance." If the amount to be updated is positive, it should be added to the current balance, and the new balance should be printed.

Implement a custom exception, InvalidAmountException, and InsufficientBalanceException, to manage his bank account.

Input Format

The first line of input consists of a double value 'd', representing the initial account balance.

The second line of input consists of a double value 'd1', representing the amount to be updated.

Output Format

The output is displayed in the following format:

If the validation passes, print

"Account balance updated successfully! New balance: {new_balance}"

where {new_balance} is the updated account balance.

If the initial bank amount is negative it displays

"Error: Invalid amount. Please enter a positive initial balance."

If the updated amount exceeds the initial account balance in withdrawal it displays

"Error: Insufficient balance."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1000

500

Output: Account balance updated successfully! New balance: 1500.0

Answer

```
// You are using Java  
import java.util.*;
```

```
class InvalidAmountException extends Exception{  
    public InvalidAmountException(String message){  
        super(message);  
    }  
}  
  
class InsufficientBalanceException extends Exception{  
    public InsufficientBalanceException(String message){  
        super(message);  
    }  
}  
  
public class Main{  
    public static void validateBalance(double balance) throws  
    InvalidAmountException{  
        if(balance<0)  
            throw new InvalidAmountException("Error: Invalid amount. Please enter a  
positive initial balance.");  
    }  
    public static void validateAmount(double balance, double amount) throws  
    InsufficientBalanceException{  
        if(amount<0 && balance+amount<0)  
            throw new InsufficientBalanceException("Error: Insufficient balance.");  
    }  
  
    public static void main(String args[]){  
        Scanner sc=new Scanner(System.in);  
        double balance=sc.nextDouble();  
        double amount=sc.nextDouble();  
        try{  
            validateBalance(balance);  
            validateAmount(balance,amount);  
            balance+=amount;  
            System.out.println("Account balance updated successfully! New balance:  
"+balance);  
        }  
        catch(InvalidAmountException e){  
            System.out.println(e.getMessage());  
        }  
        catch(InsufficientBalanceException e){  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

Alice is designing a program that requires users to enter positive numbers. She wants to implement a solution that validates whether the entered number is positive. In case the input is not a positive number, she wants to throw a custom exception.

The number should be a positive integer. If this condition is violated, the program should throw a custom exception: InvalidPositiveNumberException with the message "Invalid input. Please enter a positive integer."

Implement a custom exception, InvalidPositiveNumberException , to handle cases where the entered number does not meet the specified criteria.

Input Format

The input consists of an integer value 'n', representing the entered number.

Output Format

The output is displayed in the following format:

If the validation passes, print

"Number {number} is positive."

The {number} represents the entered positive integer.

If the entered number is negative then it displays

"Error: Invalid input. Please enter a positive integer."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 100

Output: Number 100 is positive.

Answer

```
// You are using Java
import java.util.*;

class InvalidPositiveNumberException extends Exception{
    public InvalidPositiveNumberException(String message){
        super(message);
    }
}

public class Main{
    public static void validatePositiveNumber(int number) throws
    InvalidPositiveNumberException{
        if(number<0){
            throw new InvalidPositiveNumberException("Error: Invalid input. Please
enter a positive integer.");
        }
    }

    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        int number=sc.nextInt();
        try{
            validatePositiveNumber(number);
            System.out.println("Number "+number+" is positive.");
        }
        catch(InvalidPositiveNumberException e){
            System.out.println(e.getMessage());
        }
    }
}
```

3. Problem Statement

In an online shopping cart system, users can apply coupon codes during checkout to avail of discounts. However, to ensure the validity and security of coupon codes, the system enforces specific rules for their format. Your task is to implement a Java program named CouponCodeValidator that takes user input for a coupon code and validates it according to the specified rules.

Rules for Valid Coupon Code:

The coupon code must consist of exactly 10 characters. The coupon code must contain at least one alphabet (uppercase or lowercase) and at least one digit (0-9). Special characters are not allowed in the coupon code.

Implement a custom exception, InvalidCouponException, to handle cases where the entered coupon code does not meet the specified criteria.

Input Format

The input consists of a string s, representing the coupon code.

Output Format

The output is displayed in the following format:

If the entered coupon code meets the specified criteria, the program outputs

"Coupon code applied successfully!"

If the entered coupon code has less than or more than 10 characters it outputs

"Error: Invalid coupon code length. It must be exactly 10 characters."

If the entered coupon code contains only numeric or only alphabets it outputs

"Error: Invalid coupon code format. It must contain at least one alphabet and one digit."

If the entered coupon code contains special characters it outputs

"Error: Coupon code should not contain special characters."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: ABCD123456

Output: Coupon code applied successfully!

Answer

```
// You are using Java
import java.util.*;

class InvalidCouponException extends Exception{
    public InvalidCouponException(String message){
        super(message);
    }
}

public class Main{
    public static void validateCoupon(String coupon) throws
    InvalidCouponException{
        if(coupon.matches(".*[!#@$%^&*].*")){
            throw new InvalidCouponException("Error: Coupon code should not
contain special characters.");
        }
        if(coupon.length()!=10){
            throw new InvalidCouponException("Error: Invalid coupon code length. It
must be exactly 10 characters.");
        }
        if(!(coupon.matches(".*[A-Za-z].*") && coupon.matches(".*[0-9].*"))){
            throw new InvalidCouponException("Error: Invalid coupon code format. It
must contain at least one alphabet and one digit.");
        }
    }

    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        String coupon = sc.nextLine();
        try{
            validateCoupon(coupon);
            System.out.println("Coupon code applied successfully!");
        }
        catch(InvalidCouponException e){

```

```
        System.out.println(e.getMessage());
    }
}
}
```

Marks : 10/10

4. Problem Statement

A company is developing a user registration system that requires users to provide valid email addresses. The development team is implementing an EmailValidator program to ensure that the entered email addresses meet certain criteria using exception handling.

The email address must contain the "@" symbol. The email address must consist of a non-empty username(before "@" symbol) and a non-empty domain(after "@" symbol). The domain part of the email address must contain at least one period ("."). The email address must not contain leading or trailing spaces.

Implement a custom exception, InvalidEmailException, to fulfill the company's requirements and validate it according to the specified rules.

Input Format

The input consists of a string value 's', which represents the email address.

Output Format

The output is displayed in the following format:

If the entered email address is valid according to the specified rules, the program prints:

"Email address is valid!"

If the entered email address misses the username or domain part or misses "@" symbol or has two or more "@" symbols or misses '.' in the domain part it outputs:

"Error: Invalid email format."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: john Doe@example.com

Output: Email address is valid!

Answer

```
// You are using Java
import java.util.*;

class InvalidEmailException extends Exception{
    public InvalidEmailException(String message){
        super(message);
    }
}

public class Main{
    public static void validateEmail(String email) throws InvalidEmailException{
        if(!email.trim().equals(email)){
            throw new InvalidEmailException("Error: Invalid email format.");
        }
        if(!email.contains("@") || email.indexOf "@" != email.lastIndexOf "@")){
            throw new InvalidEmailException("Error: Invalid email format.");
        }
        String[] parts=email.split "@";
        if(parts.length!=2){
            throw new InvalidEmailException("Error: Invalid email format.");
        }
        String username=parts[0];
        String domain=parts[1];

        if(username.isEmpty() || domain.isEmpty()){
            throw new InvalidEmailException("Error: Invalid email format.");
        }
        if(!domain.contains "."){
            throw new InvalidEmailException("Error: Invalid email format.");
        }
    }
}
```

```
}

public static void main(String args[]){
    Scanner sc=new Scanner(System.in);
    String email=sc.nextLine();
    try{
        validateEmail(email);
        System.out.println("Email address is valid!");
    }
    catch(InvalidEmailException e){
        System.out.println(e.getMessage());
    }
}
```
